Instructor: Peter Enrico

• Understanding MVS Busy % versus LPAR Busy % versus Physical Busy %

 During this webinar, Peter Enrico will explore the SMF 70 processor dispatch measurements and the formulas that these measurements are used with to calculate physical and logical and MVS processor utilizations. Also discussed will be the conceptual difference and usage between physical and logical utilizations.

EPS: We do z/OS performance...

- **Pivotor** z/OS performance reporting and analysis software and services
 - Not just SMF reporting, but analysis-based reporting based on expertise
 - <u>www.pivotor.com</u>
- Education and instruction
 - We teach our z/OS performance workshops all over the world
 - Want a workshop in your area? Just contact me.

• z/OS Performance War Rooms

- Intense, concentrated, and highly productive on-site performance group discussions, analysis and education
- · Amazing feedback from dozens of past clients
- MSU Reduction Exercises
 - The goal is to reduce the MSU consumption of your applications and environment
- Information
 - We present around the world and participate in online forums

z/OS Performance workshops available

During these workshops you will be analyzing your own data!

- WLM Performance and Re-evaluating Goals
 - February 19-23, 2024
- Parallel Sysplex and z/OS Performance Tuning
 - August 20-21, 2024
- Essential z/OS Performance Tuning
 - October 7-11, 2024
- Also... please make sure you are signed up for our free monthly z/OS educational webinars! (email contact@epstrategies.com)

Like what you see?

• Free z/OS Performance Educational webinars!

- The titles for our Summer / Fall 2024 webinars are as follows:
 - ✓ What a z/OS Guy Learned About AWS in 10 Years
 - ✓ Advantages of Multiple Period Service Classes
 - ✓ Understanding z/OS Connect Measurements
 - ✓ WLM and SMF 99.1 System Measurements Deeper Dive
 - ✓ WLM and SMF 99.2 Service Class Period Measurements Deeper Dive
 - ✓ Optimizing Performance at the Speed of Light: Why I/O Avoidance is Even More Important Today
 - Understanding MVS Busy % versus LPAR Busy % versus Physical Busy %
 - Rethinking IBM Software Cost Management Under Tailored Fit Pricing
 - Understanding Page Faults and Their Influence on Uncaptured Time
 - Response Time Goals: Average or Percentiles?
 - Understanding and Using Enclave
- If you want a free cursory review of your environment, let us know!
 - We're always happy to process a day's worth of data and show you the results

Physical Busy % vs LPAR Busy % vs MVS Busy %

• PR/SM Physical Busy Utilization

- Helps us gain insights into the physical constraints of the machine / CEC
- Based on the number of physical processors and dispatch times

• PR/SM LPAR (Logical) Busy Utilization

- Helps us gain insights into the logical constraints of the LPAR / z/OS system
- Based on number of logical processors and dispatch times

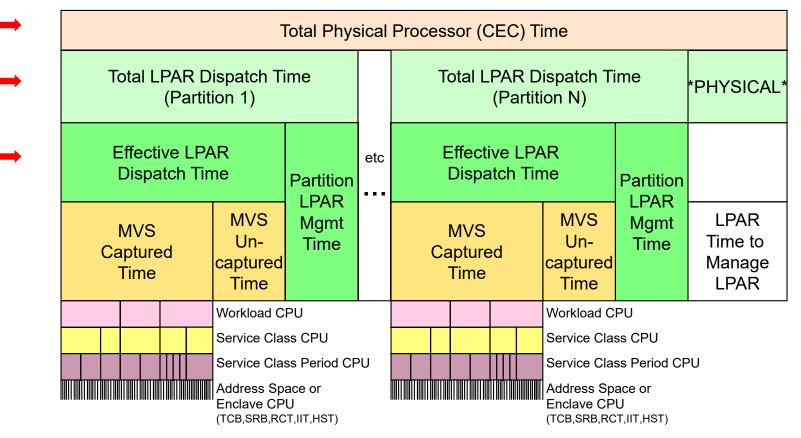

MVS Busy Utilization

- Helps us gain insights into the demand for CPU by the LPAR / z/OS system
- Based on the number of logical processors and wait times

Breakdown of General-Purpose Processor

• We always needed to understand the break down of CP CPU consumption

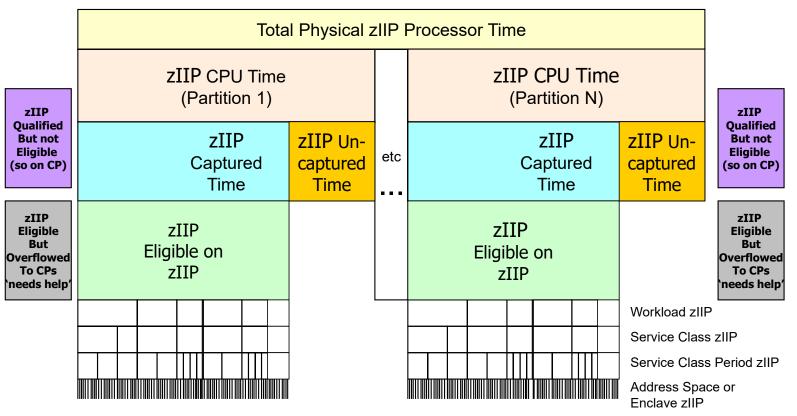

Breakdown of zIIP Engine Time

• We need to understand how PR/SM allocates the zIIP processor resource

• In all measurements zIIPs

LPAR Terminology Review

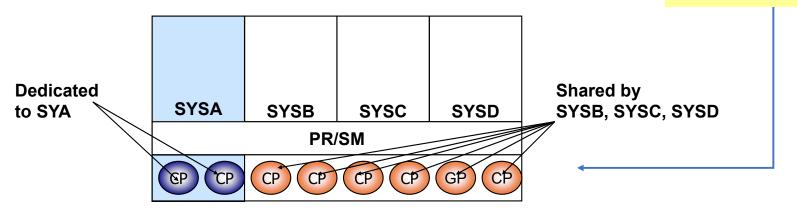

• Physical Processors

- Physical CEC processors that are used by the different partitions
- Processors can be
 - GCP General CPU Processor
 - ICF Integrated Coupling Facilities
 - IFL Integrated Facilities for Linux
 - zIIP zArchitecture Integrated Information Processor

Physical Utilization helps us understand how busy this physical processor pool is

Same exercise for each pool of processors

- GCPs
- ICFs
- IFLs
- zIIPs

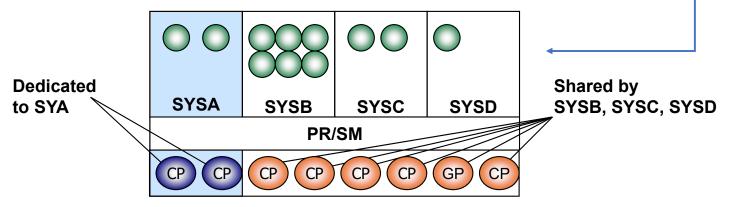

LPAR Terminology Review

Logical Processor

- Each system image as some number of logical processors assigned
 - System image thinks it has 100% of its number of processors
- Dedicated processors
 - Physical processor dedicated to a partition 100% of the time
 - Accumulates both CPU using and wait/idle time
- Shared logical processors
 - Physical processor that can be share among one or more partitions
 - Physical processors not dedicated to a particular partition

Logical Utilization helps us understand how busy each LPARs logical pool of processors is.

- How busy is SYSA's 2 logical CPs
- How busy is SYSB's 6 logical CPs
- How busy is SYSC's 2 logical CPs
- How busy is SYSD's 1 logical CP

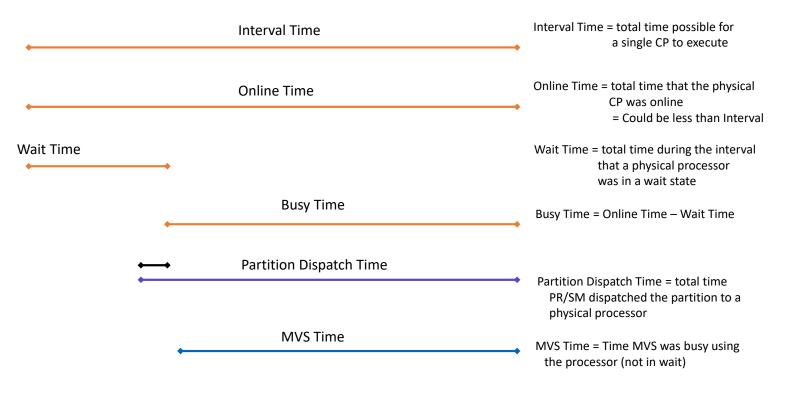

CPU Time in PR/SM

• There are a variety of time values to understand

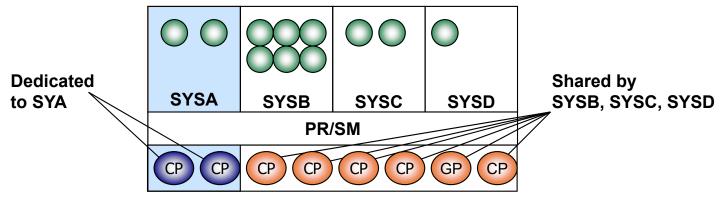

• From a single CP point of view, some of these times are as follows:

LPAR Terminology Review

- Say SYSC is using 100% of its logical capacity
- Would adding another physical CPU to the CEC help?

© Enterprise Performance Strategies

14

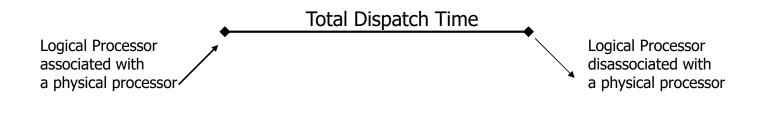

Dispatch Time

- Partition Effective Dispatch Time
 - Time a physical CPU was dispatched to a logical CPU during measurement interval
 - Think of this as time that z/OS system and the workloads got to use the physical CPU
 - For *PHYSICAL* this value is blank
- Partition Total Dispatch Time
 - Includes Effective Dispatch Time plus LPAR Management time
 - For *PHYSICAL* this value is includes the processor time that cannot be attributed to any one partition
 - Time that LPAR spent managing itself

• LPAR Management Time = Delta between Total Time and Effective Time

• Time PR/SM spent managing a particular partition

Example of RMF Partition Data Report

$\label{eq:particular} P \ A \ R \ T \ I \ T \ I \ O \ N \quad D \ A \ T \ A \quad R \ E \ P \ O \ R \ T$

Physical Processor Utilizations

• Physical utilizations

- Helps to understand the utilization of the constraint due to the number of physical processors active on the machine
- Physical Processor Utilization Effective
 - Percentage of the measurement interval that the partition was utilizing a physical processor on behalf of itself
 - Online time is related to the interval time. A single CPU cannot be online longer than measurement interval

 $\frac{\sum Partition Effective Dispatch Times}{No of Physcial Processors * Online Time} * 100$

• Physical Processor Utilization Total

- Percentage of the measurement interval that the partition was utilizing a physical processor on behalf of itself and for LPAR management time attributed to the partition
- Online time is related to the interval time. A single CPU cannot be online longer than measurement interval

 $\frac{\sum \text{Partition Total Dispatch Times}}{\text{No of Physical Processors * Online Time}} * 100$

Logical Processor Utilizations

• Logical utilizations

- Helps to understand the utilization of the constraint due to the number of logical processors assigned to the partition
- Logical Processor Utilization Effective
 - Percentage of the measurement interval that the partition was utilizing a logical processor on behalf of itself

 $\frac{\sum \text{Partition Effective Dispatch Times}}{\text{No of Logical Processors * Online Time}} * 100$

- Logical Processor Utilization Total
 - Percentage of the measurement interval that the partition was utilizing a logical processor on behalf of itself and for LPAR management time attributed to the partition

 $\frac{\sum \text{Partition Total Dispatch Times}}{\text{No of Logical Processors * Online Time}} * 100$

LPAR Management Times and Utilizations

- LPAR Management Time
 - Time PR/SM spent managing a partition
 - For the partition '*PHYSICAL*", this is the amount of time PR/SM spent managing itself. It is time that could not be attributed to any single partition.

Physical Processor Utilization LPAR Management

• Percentage of the measurement interval that PR/SM spent managing the partition. It is reported as a percentage of total physical time possible

 $\frac{\Sigma \frac{Partition Total}{Dispatch Times} - \Sigma \frac{Partition Effective}{Dispatch Times}}{No of Physcial Processors *Interval Time} * 100$

• *PHYSICAL* Partition

 $\frac{\sum Partition Total Dispatch Time for partition PHYSICAL}{No of Physical Processors *Interval Time} * 100$

RMF Partition Data Report – Machine Utilization Values

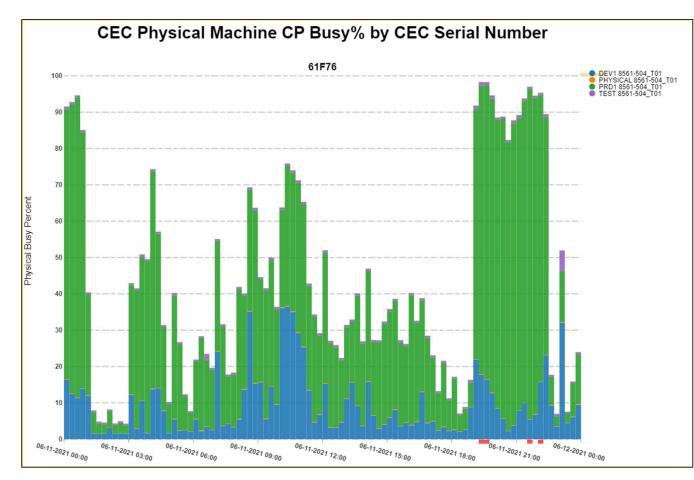

• Total lines

- Reports the total utilization of the physical processors on the machine
- Provides a view of total utilization by all LPARs of physical processor resource

Example of Physical Processor Busy

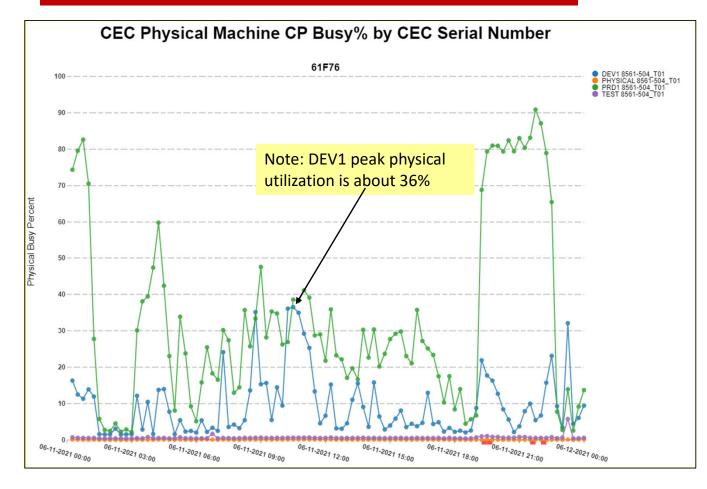

For each logical partition, the physical utilization of the machine is a function of the number of physical processors.

The partitions of all partitions is based on the number of physical processors of the machine, and not the number of logical processors assigned to the partition.

Enterprise Performance Strategies, Inc. ©

Physical Machine Utilization as Line Chart

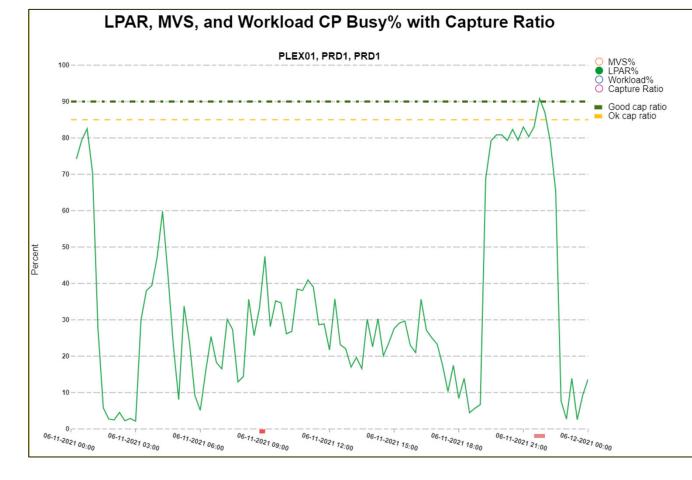

For each logical partition, the physical utilization of the machine is a function of the number of physical processors.

The utilization of each partition is based on the number of physical processors of the machine, and not the number of logical processors assigned to the partition.

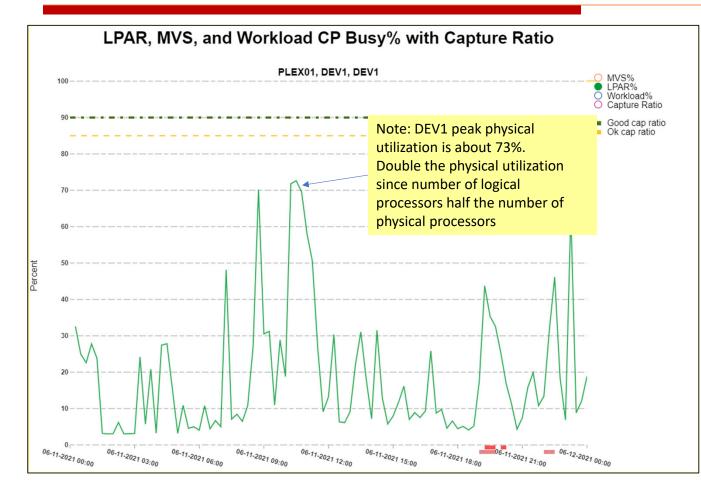

Example of Logical Processor Busy

When the number of logical processors assigned to a partition is equal to the number of physical processors on the CEC, the LPAR utilization for that LPAR will equal the physical utilization for that LPAR.

Enterprise Performance Strategies, Inc. ©

When the number of logical processors assigned to a partition is NOT equal to the number of physical processors on the CEC, the LPAR utilization for that LPAR will be higher since we are looking at the constraint of the number of logical processors.

Enterprise Performance Strategies, Inc. ©

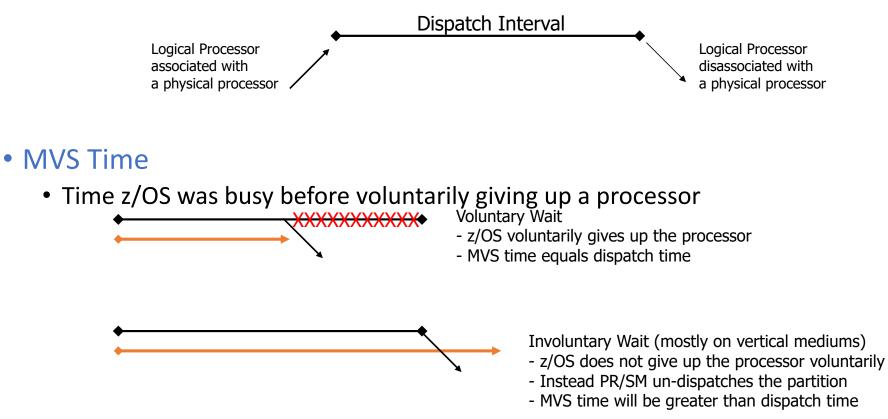

So, what is MVS Busy %?

Instructor: Peter Enrico

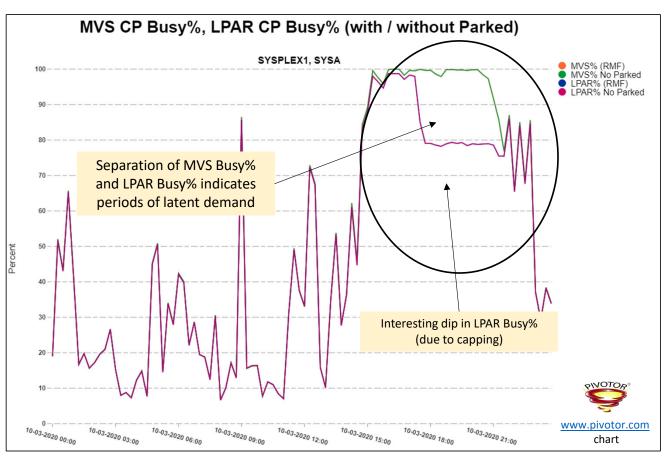

Understanding Dispatching to Gain Insights to MVS Busy %

- Dispatch Time
 - Time logical processor is associated with a physical processor

LPAR Busy % with Config CPs and only Unparked CPs

- LPAR Busy % based on configured number of logical processors
 - Reports logical constraint of the LPAR
- LPAR Busy % based on unparked number of logical processors
 - Reports the HiperDispatch constraint

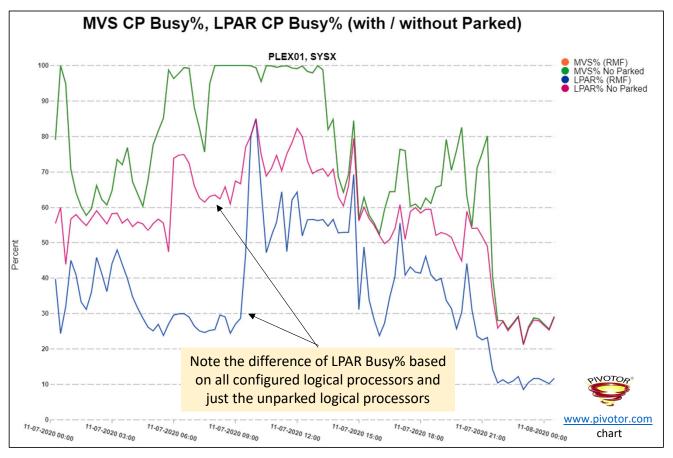

Enterprise Performance Strategies, Inc. ©

Latent Demand - 27

ROTON

LPAR Busy % with Config CPs and only Unparked CPs 🏒

- LPAR Busy % based on configured number of logical processors
 - Reports logical constraint of the LPAR
- LPAR Busy % based on unparked number of logical processors
 - Reports the HiperDispatch constraint

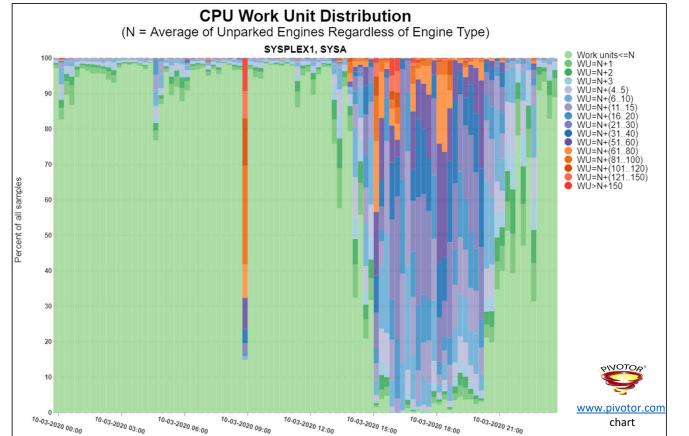

Enterprise Performance Strategies, Inc. ©

Latent Demand - 28

RIVOTOR

Distribution of work unit queue lengths

- Each bucket of the distribution represents the percentage of the measurement interval the queue of work waiting to use the CPUs is a certain length:
 - N = number of unparked CP + zIIP engines

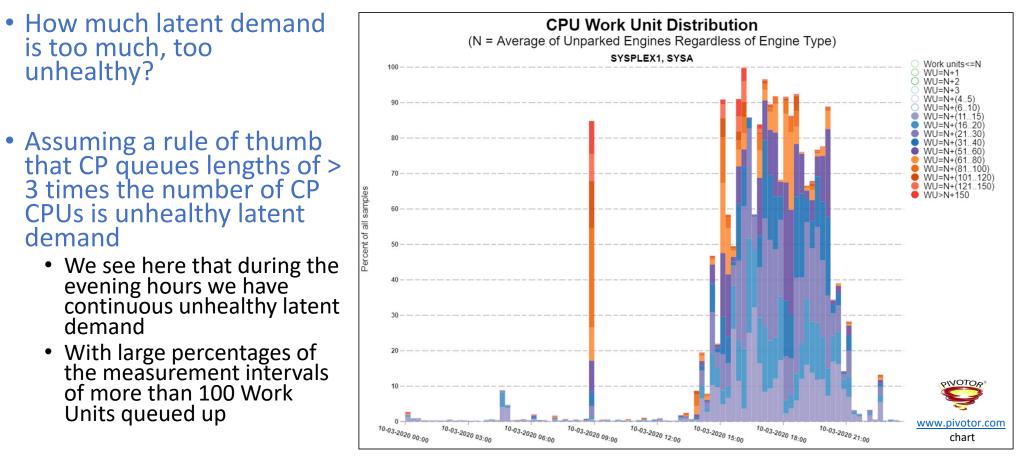

Latent Demand - 29
